

Assessment of Run B14 2012: Individual results

Aalborg, December 2012

NordIQ has assessed your submitted stains as shown in the table below.

The assessment is generally based on the staining intensity and distribution in cells expected to stain, background staining, cross-reactivity, counter-staining and preservation of tissue structures. More specific criteria for each marker are described on www.nordiqc.org → Assessments.

Each stained slide is marked as *optimal*, *good*, *borderline* or *poor*.

Optimal staining: The stain is considered perfect or close to perfect in all of the included tissues.

Good staining: The stain is considered fully acceptable in all of the included tissues. However, the protocol may be optimized to ensure the best sensitivity or signal-to-noise ratio.

Borderline staining: The stain is considered insufficient because of, e.g., a generally too weak staining or a false negative staining of one of the included tissues, or a false positive staining reaction. The protocol should be optimized.

Poor staining: The stain is considered very insufficient because of, e.g., false negative staining of several of the included tissues, or a marked false positive staining reaction. An optimization of the protocol is urgently needed.

Moderate or strong cross reaction (due to, e.g., the character of the primary antibody) or other false positive staining reaction (due to, e.g., endogenous biotin) is not compatible with an optimal result and will usually cause down marking.

For stains assessed as borderline or poor, comments and recommendations are given to the protocols. Also a good stain may be given a comment if a specific problem is identified.

Please compare the optimal stains and recommended protocols published on www.nordiqc.org with your own stains and protocols. A protocol recommended by NordIQ as well as changes suggested in this letter must be tested carefully in your own laboratory before implementation into the diagnostic work. NordIQ cannot take any responsibility for the consequences of changes of protocols or methods in a laboratory.

In case of a borderline or poor staining result, the laboratory may - not later than the deadline for the immediate subsequent run - request a reassessment of the original stain or based on a new stain (apart from HER-2 IHC which are also included in the next run). To obtain a new slide, a protocol must be submitted on the website: In the protocol form 6, <http://www.nordiqc.org/Participation.htm> slides for reassessment can be requested. The slides for reassessment will be circulated together with slides for the subsequent run.

Please note that borderline and poor marks do not necessarily indicate a poor performance in the laboratory. Some of the tissues/tumours included in the multi tissue blocks are really challenging. However, all marks less than optimal should encourage the laboratories to analyze and adjust their protocols for improvement to be able to cope with difficult cases, e.g., tumours that express few epitopes or much biotin.

When assessed, your HER-2 IHC staining will also be interpreted and scored by NordIQ. If "Scoring consensus" in your Individual results is marked "Yes", it means that the NordIQ assessor group gave the same scores as you did for all the tissue cores (irrespective of your staining being marked as optimal, good, borderline or poor).

Participant no.:	NQC750	
Laboratory:	Institut für Pathologie	
Hospital:	Ev. Krankenhaus BETHESDA zu Duisburg GmbH	
Contact person(s):	Johanna Wezgowiec, Christine Haferkamp, Prof. Dr. med. C. D. Gerharz	
Marker	HER-2 IHC	PR
Assessment:	Optimal	Optimal
Comments to the protocol:	-	-
Suggestions for improvement:	-	-
Scoring consensus - Laboratory vs. NordIQ	YES
